

HIGH PERFORMANCE PISTON RINGS

The conditions encountered in modern high performance engines make great demands on component design.

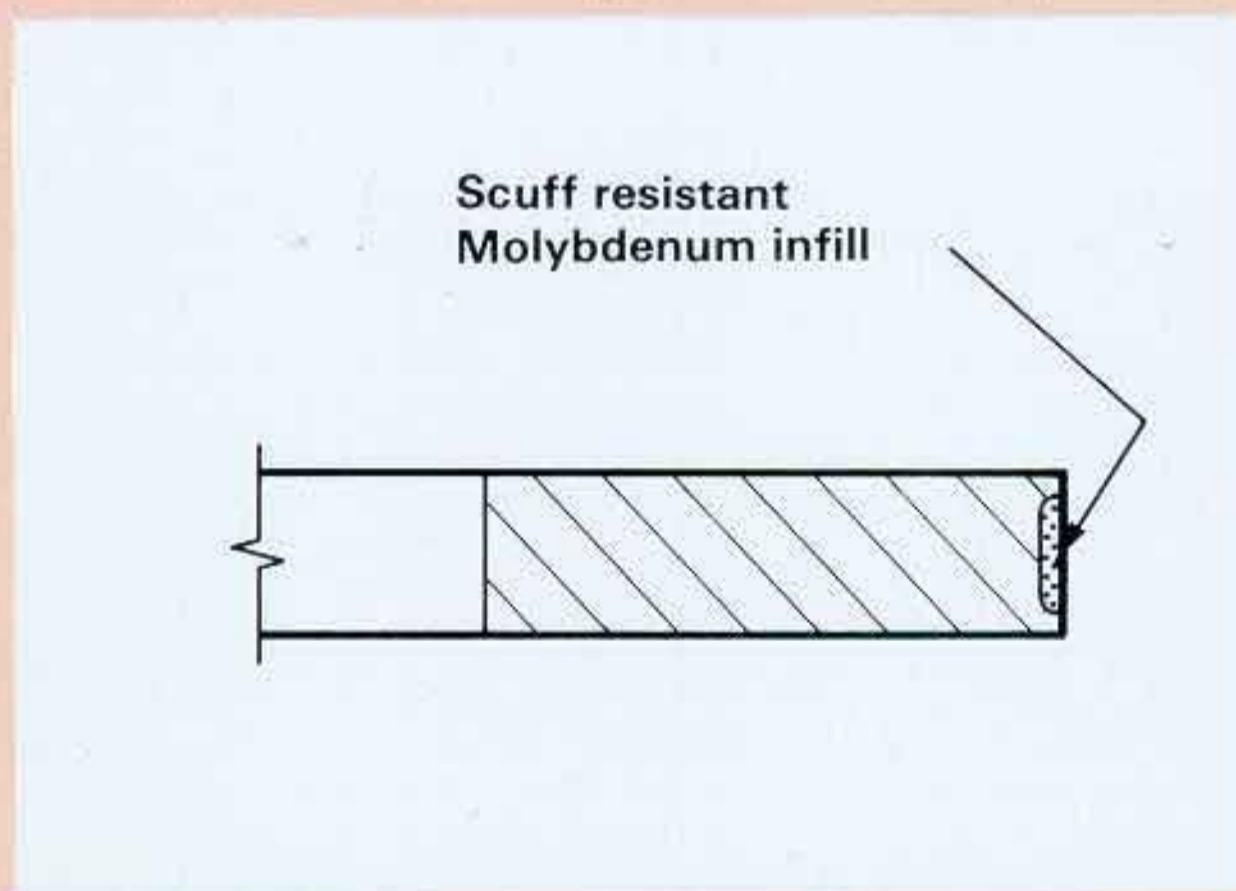

Piston rings are subjected to high temperatures and accelerations with minimum lubrication.

Cross rings are of thin, lightweight design, made of tough alloy steel for good resistance to heat collapse and no risk of breakage.

The addition of an infill of Molybdenum reduces scuffing between ring and bore.

Cross rings are fitted to Cosworth DFV and DFX racing engines.

Cars powered by the Cosworth DFX engine fitted with Cross rings have taken many firsts in the Indianapolis Series.

The Cosworth DFV engine has numerous Grand Prix successes to its credit.
